A MOTHER
AND A FATHER**

VOTE NO

Existing measures of issue salience

- MIP surveys (RePass 1971, Miller et al. 1976)
- media coverage (Baumgartner and Jones 1993, Epstein and Segal 2000)
- Internet search data (Ripberger 2011, Mellon 2014)

Existing measures of issue salience

- MIP surveys (RePass 1971, Miller et al. 1976)
- media coverage (Baumgartner and Jones 1993, Epstein and Segal 2000)
- Internet search data (Ripberger 2011, Mellon 2014)

	survey data (MIP)	media data	Internet search data
pros	individual-level measure, long historical record, direct measure	low costs, frequency, flexibility, long historical record	low costs, frequency, flexibility, broad coverage
cons	costs, sparseness, limited coverage, validity concerns	aggregate-level, bridging assumptions, media variable 'burnt'	aggregate-level measure, lack of transparency, limited time series

An alternative approach

Strategy

- identify set of appropriate *Wikipedia* articles (subject to validation)
- monitor daily-level page view counts
- derive measure of salience

Rationale

- *Wikipedia* main web information source of choice
- people search for certain topics/issues out of interest/attention
- measure short-term attention and long-term salience towards issues using page view counts of selected *Wikipedia* articles

Example

Wikipedia page view counts for the article 'Energiewende'.

Assumptions

1. Aggregate page view data reflect the average importance of issues among *Wikipedia* users.
2. Public issue salience of *Wikipedia* users and the general public is equivalent.
3. *Wikipedia* provides relevant information for the topic of interest.
4. Changes in page view data reflect changes in issue importance.

Validation strategy

- **face and content validity:** selection and investigation of articles
- **criterion validity:** comparison with survey [and Google Trends] data
- **predictive validity** using parliamentary interpellations [to be done]

Data

- MIP data: German survey data (*Politbarometer* study), bi-weekly since 2006, pre-coded categories
- *Wikipedia* data: daily-level raw counts, February 2008 to December 2013, taken from <http://stats.grok.se>
- focus on the four most popular issues: ‘Unemployment’, ‘Europe/EU’, ‘Economy’, ‘Financial crisis’

Selected articles

Issue	Article name	# views	avg. views	max. views
Unemployment	Arbeitslosengeld_II	2,140,971	986	7,973
	Arbeitslosigkeit	1,354,892	624	2,434
	Arbeitslosenversicherung	1,248,687	575	4,938
	Arbeitslosenstatistik	991,693	457	2,515

	Konjunktur	0.71	0.30	
	Wirtschaft	-0.09	0.18	
	Wirtschaft_Deutschlands	-0.85	0.13	
	Wirtschaftswachstum	-0.19	0.36	

Conclusion

- proof of concept: *Wikipedia* article views can serve as an aggregate indicator of public issue attention (== salience?) if combined
- promising measure for (a) single-issue analyses and (b) testing hypotheses on short-term attention (McCombs and Zhu 1995)

Conclusion

- proof of concept: *Wikipedia* article views can serve as an aggregate indicator of public issue attention (== salience?) if combined
- promising measure for (a) single-issue analyses and (b) testing hypotheses on short-term attention (McCombs and Zhu 1995)

To-do list

- ☐ extend test on criterion validity with external criterion
- ☐ assess reliability with out-of-sample testing
- ☐ expand set of issues
- ☐ establish more efficient combination procedure
- ☐ investigate other Wikis

Thank you for your attention!

Weekly seasonality

Wikipedia page view counts (red curve) time series for the ‘Energiewende’ article in 2013. The time series exhibits considerable seasonality because page view statistics use to drop at weekends.
